

specs for Sets

- declare some collection of Strings
- write a function called add that adds Strings to the collection
- write a function getSize that returns the number of unique elements added to the collection (i.e. if you call add("the") five times it counts only once)
- write a function called getCollection that returns the collection as a String

Example:

```
% java SetExample
enter a string: now
enter a string: is
enter a string: the
enter a string: time
enter a string: for
enter a string: all
enter a string: men
enter a string: now
enter a string: time
enter a string: men
enter a string: time
enter a string:
7
[the, all , now, men, for, is, time]
%
```
